### Summary of Research

In total 451 clinical cases from six studies were included in the meta-analysis. Five of six trials were randomised. The overall CR with radiotherapy alone was 39.6% (92/232) and varied between 31.3% and 46.9% across the six trials.

With thermoradiotherapy, the overall CR reported was 62.5% (137/219), (range 33.9-83.3%). The odds ratio was 2.92 (95% CI: 1.58-5.42, p = 0.001); the risk ratio was 1.61 (95% CI: 1.32-1.97, p < 0.0001) and the risk difference was 0.25 (95% CI: 0.12-0.39, p < 0.0001), all in favour of combined treatment with hyperthermia and radiotherapy over radiotherapy alone. Acute and late grade III/IV toxicities were reported to be similar in both the groups.

#### **Overall Complete Response %**

#### Conclusions

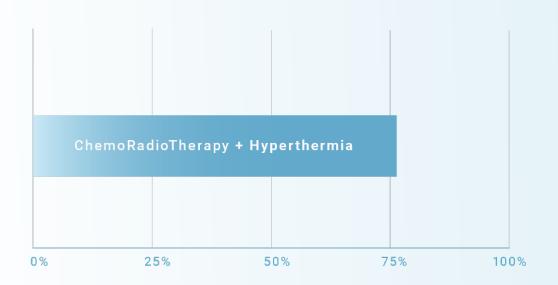

Hyperthermia along with radiotherapy enhances the likelihood of CR in HNCs by around 25% compared to radiotherapy alone with no significant additional acute and late morbidities. This level I evidence should justify the integration of hyperthermia into the multimodality therapy of HNCs.

#### Risk Difference: RT+HT vs RT

Between May 2004 and May 2008, 40 patients with advanced head and neck cancers were treated with HT and chemoradiotherapy (70 Gy in 7 weeks and weekly cisplatin 50 mg or paclitaxel 60 mg). Treatment toxicity was not increased and the complete response was 76.23%. Overall survival (Kaplan-Meir) was 75.69% at 1 year and 63.08% at 2 years.

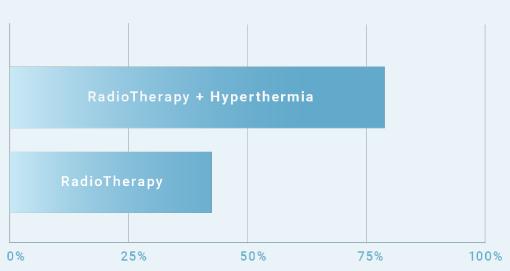

#### **Complete Response %**

#### **Overall survival %**

Huilgol N.G. (2010b) administered RT to 26 patients and RT with HT (weekly) to 28 patients in a trial to evaluate the effects of HT on RT on head and neck tumours. All patients were matched according to age, sex, and stage of disease. All patients received 66-70 Gy in 6.5-7 weeks. The complete response in the RT group was 42.4% and in the RT plus HT group it was 78.6% (p<0.05). The increase in OS rates in the RT plus HT group was also significant (Kaplan-Meir analysis). No dose limiting thermal burns and treatment toxicity were recorded.

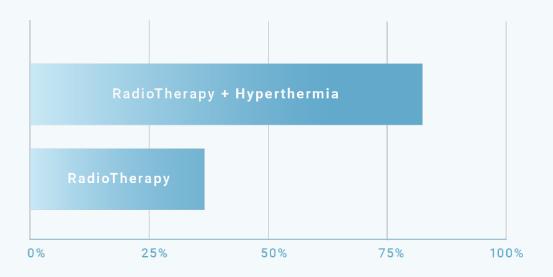

Complete Response %

41 patients (44 nodes) with advanced Stage IV squamous cell cervical lymph nodes of the head and neck were randomised to receive treatment with RT alone or in combination with HT.

Both treatment response (82.3% in the HT group versus 36.8% in the group receiving RT alone) and increase in 5 year survival rates were significantly better in the combined group (p=0.0164 and p=0.015 respectively).

There was no increase in acute treatment toxicity in the HT group, however two patients developed bone necrosis later which may have been related to the combined treatment.

#### **Treatment Response %**

#### Why patients need this treatment

Head and neck tumours are associated with disfiguration and decreased quality of life. While early stage head and neck tumours respond well to radiotherapy, more advanced tumours have a poorer outcome.

Improving the outcomes for these patients offers the possibility of decreased morbidity and improved quality of life and survival.

### **Cost vs Clinical Efficacy**

Modulated electro-hyperthermia is not an expensive modality in comparison to radiotherapy, chemotherapy and surgery and the additional cost of the treatment could prevent costs associated with residual disease post-treatment in the event of treatment failure.

### Medical Device Details

### Oncotherm EHY2000 & EHY2030

The Oncotherm EHY2000 and most recent model EHY 2030 are both manufactured in Hungary with CE certification, registered with SAHPRA in South Africa as a medical device, and contracted into a rigorous maintenance plan with autocalibration following each treatment session.

The EHY2000 has been operational in South Africa for over 8 years adjacent the Wits Donald Gordon Radiation Oncology Unit; and first trialled in a phase III clinical study at the Charlotte Maxeke Johannesburg Academic Hospital from 2014-2017 with excellent clinical results. Additionally the study reported on easy integration into the workflow, affordability and a favourable safety and tolerability profile. This included vulnerable and high risk population groups such as HIV-positive and obese patients.

### **Mechanism of Action**

The method transfers energy using the principle of capacitive coupling radio waves of 13,56 MHz over through the region of tumor tissue with heterogenous targeting of malignant tissue and the surrounding tumor microenvironment. This results in improved oxygenation and radiosensitisation at the core of solid tumors, improved drug delivery and drug reaction rate / chemo-sensitization, destabilizing thermal stress on tumor lipid raft membranes leading to necrosis and apoptosis, immune recognition and documented abscopal effects; further modified immune response within the TME with the release of HSP and increased NK cell activity; and significantly impaired DNA repair mechanisms following chemoradiation.

## Accepted Hyperthermia Protocols

- Oncotherm EHY2000 is a registered medical device with SAHPRA
- Patient lies supine on de-ionized waterbed with a locoregionally positioned applicator 20-30cm with energy output at 150W for 60-90min, modulated
- Applicator, size of probe and duration of treatment are dependent on site of Ca
- When combined with chemotherapy, hyperthermia is administered on the same day and within 1hr of the chemotherapy continued at 2-3 sessions per week at 48hrly intervals apart until the following cycle of chemotherapy
- When combined with radiotherapy: one modulated electro-hyperthermia session administered after each fraction of radiation in the case of Stereotactic bodyirradiation, or 2-3 times per week during normal fractionated external beam irradiation or until completion of RT

#### Simplified:

- One cycle is 4 weeks. The first 2 cycles, 8 weeks, requires 3 x 60-90min sessions per week, 48hrs apart.
- Hereafter 4 further cycles are considered as maintenance, 2 x 60-90min / week. A total of 6 cycles is generally recommended.
- In certain clinical settings, such as Glioblastoma, ongoing treatment > 6 cycles is recommended. In other settings, as with Cervical, only 2 initial cycles are recommended c/w CRT.
